

# XIP3322B: HKDF/HMAC/SHA-256

## SHA-256 IP Core with Extended Functionalities

Product Brief

ver. 1.0

March 23, 2020

---

### Introduction

XIP3322B from Xiphera is a versatile Intellectual Property (IP) core designed for SHA-256 cryptographic hash function with extended support for HMAC message authentication code and HKDF key derivation function that are based on using SHA-256. SHA-256 is one of the most commonly used hash functions and is used in numerous cryptographic applications. XIP3322B offers a good balance between performance and resource requirements.

XIP3322B has been designed for easy integration with FPGA- and ASIC-based designs in a vendor-agnostic design methodology, and the functionality of XIP3322B does not rely on any FPGA manufacturer-specific features.

### Key Features

- **Versatility:** XIP3322B supports the widely used cryptographic hash function SHA-256. It also has native support for commonly used message authentication code (HMAC) based on SHA-256 and key derivation function (HKDF) based on HMAC. This allows using XIP3322B for multiple cryptographic functions—for example, TLS 1.3 [4]—more easily and efficiently than an IP core that supports only SHA-256.
- **Constant Latency:** The execution time of XIP3322B is independent of the message and key values (apart from message length), and consequently provides protection against timing-based side-channel attacks.
- **Performance:** XIP3322B provide has high performance and reaches hashing speeds of several hundreds of Mbps.
- **Compact Size:** XIP3322B has compact size (for example, approximately 1800 ALMs and a three memory blocks in Intel® Cyclone®V family) permitting integration into resource constrained FPGA designs.

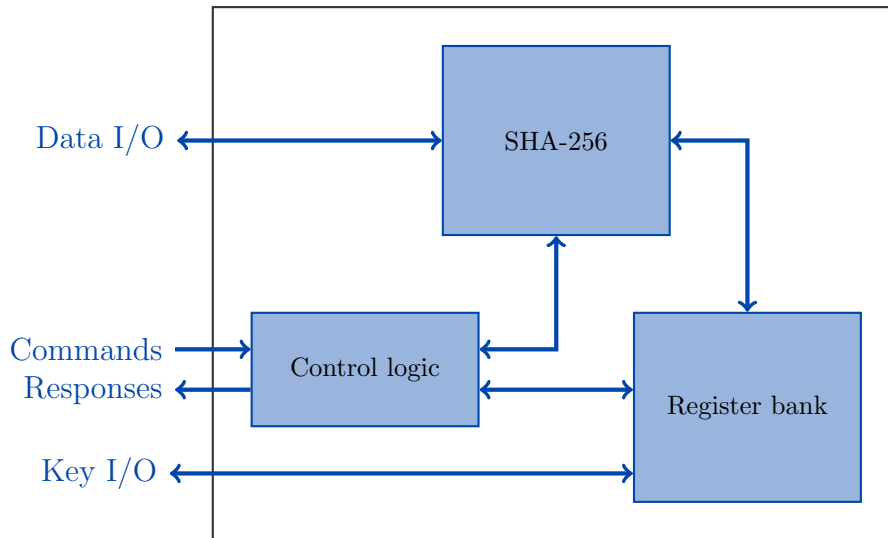

Figure 1: Internal high-level block diagram of XIP3322B

- **Standard Compliance:** XIP3322B is compliant with NIST FIPS 180-4 Secure Hash Standard (SHS) [2], FIPS 198-1 The Keyed-Hash Message Authentication Code (HMAC) [1], and RFC 5869 HMAC-based Extract-and-Expand Key Derivation Function (HKDF) [3]. Consequently, XIP3322B can be used in multiple cryptographic applications.

## Functionality

XIP3322B supports four main functionalities:

- **SHA-256:** Computes a SHA-256 hash for an input message.
- **HMAC:** Computes an HMAC authentication tag for an input message using an authentication key.
- **HKDF-extract:** Computes the HKDF-extract function that calculates a pseudorandom key from initial key material.
- **HKDF-expand:** Computes the HKDF-expand function that expands the pseudorandom key to several additional pseudorandom keys of desired lengths for specific cryptographic algorithms.

XIP3322B has a convenient 32-bit FIFO interface allowing for easy integration with rest of the FPGA design. The data inputs are loaded into XIP3322B with byte-level granularity using the `numbytes` signal that denotes the number of active bytes in a 32-bit word (0...4). The key inputs are loaded through a separate port allowing full isolation between keys and data.

## Block Diagram

The internal high-level block diagram of XIP3322B is depicted in Figure 1.

## Interfaces

The external interfaces of XIP3322B are depicted in Figure 2.

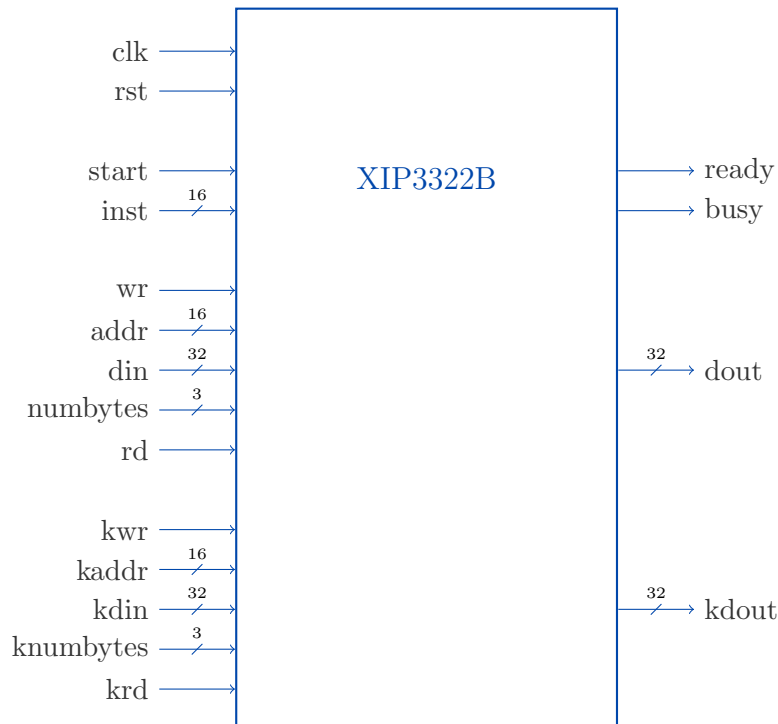

Figure 2: External interfaces of XIP3322B

This Product Brief describes a high-level overview of the functionality and capabilities of XIP3322B. Please contact sales@xiphera.com for a complete datasheet with a detailed description of the input and output signals, startup procedure of XIP3322B, example simulation waveforms, and the FPGA resource requirements of your targeted FPGA family.

## FPGA Resources and Performance

Table 1 presents the FPGA resource requirements for certain FPGAs from two leading FPGA manufacturers. On request, the resource estimates can also be supplied for other FPGA families.

Device	Resources	$f_{MAX}$
Intel® Cyclone® V GX †	1858 ALM, 3 M10K	129 MHz
Xilinx® Artix®-7 *	1553 LUT, 1.5 BRAM	125 MHz
Xilinx® Zynq UltraScale+® *	1600 LUT, 1.0 BRAM	300 MHz

† Quartus II Prime 19.1, default compilation settings, industrial speedgrade

\* Vivado 19.1., default compilation settings, industrial speedgrade

Table 1: Resource usage and performance of XIP3322B on representative FPGA families.

The general performance characteristics for different functionalities are as follows:

- **SHA-256:** 512-bit blocks of data are processed in 69 clock cycles (excluding possible interfacing delays).

- **HMAC:** An authentication tag computation requires two iterations of SHA-256, but the throughput of the computation approaches the throughput of SHA-256 for long messages.
- **HKDF:** HKDF-Extract and HKDF-Expand both require computation of a single HMAC and their performance is similar to HMAC with short messages.

## Ordering and Deliverables

Please contact [sales@xiphera.com](mailto:sales@xiphera.com) for pricing and your preferred delivery method. XIP3322B can be shipped in a number of formats, including netlist, source code, or encrypted source code. Additionally, a comprehensive VHDL testbench and a detailed datasheet are included.

## About Xiphera

Xiphera specializes in secure and efficient implementations of standardized cryptographic algorithms on Field Programmable Gate Arrays (FPGAs). Our product portfolio includes individual cryptographic Intellectual Property (IP) cores, as well as comprehensive security solutions built from a combination of individual IP cores.

Xiphera is a Finnish company operating under the laws of the Republic of Finland, and is fully owned by Finnish citizens.
