

PEACE OF MIND IN A DANGEROUS WORLD

## XIP113B: AES256-GCM

# Advanced Encryption Standard (256-bit key), Galois Counter Mode IP Core

Product Brief

ver. 1.4.1

January 29, 2024

sales@xiphera.com

## Introduction

XIP113B from Xiphera is a balanced Intellectual Property (IP) core implementing the Advanced Encryption Standard (AES) [2] in Galois Counter Mode (GCM) [3]. AES-GCM is a widely used cryptographic algorithm for Authenticated Encryption with Associated Data (AEAD) purposes, as it provides both data confidentiality and authenticity.

XIP113B has been designed for easy integration with FPGA- and ASIC-based designs in a vendor-agnostic design methodology, and the functionality of XIP113B does not rely on any FPGA manufacturer-specific features.

## Key Features

- **Compact** resource requirements: The entire XIP113B requires 3626 Lookup Tables (LUTs) (AMD<sup>®</sup> Zynq-7000<sup>®</sup> ), and does not require any multipliers, DSPBlocks or internal memory<sup>1</sup> in a typical AMD<sup>®</sup> FPGA implementation.
- **Performance:** Despite its compact size, XIP113B achieves a throughput in the Gbps range<sup>2</sup>, for example 4.44+ Gbps in AMD<sup>®</sup> Kintex<sup>®</sup> UltraScale+.
- **Standard Compliance:** XIP113B is fully compliant with both the Advanced Encryption Algorithm (AES) standard [2], as well as with the Galois Counter Mode (GCM) standard [3].
- **Test Vector Compliance:** XIP113B passes all test vectors specified in [1].
- **Flexible Interfaces** ease the integration of XIP113B with other AMD<sup>®</sup> FPGA logic and/or control software.

<sup>1</sup>The parameterizable input and output FIFOs may optionally be instantiated with internal memory blocks, but the actual XIP113B kernel requires only logic resources.

<sup>2</sup>As is typical for AEAD algorithms, the highest throughput is achieved for long messages.

## Functionality

The main functionality of XIP1113B depends on the mode of operation. When XIP1113B operates in the encryption and authentication tag calculation mode, it encrypts the incoming plaintext blocks into ciphertext blocks, and in addition to this also calculates a 128 bits long authentication tag from both the incoming plaintext and associated data. When XIP1113B operates in the decryption and tag validity checking mode, it decrypts the incoming ciphertext blocks into plaintext blocks, and validates the received authentication tag value by calculating the tag from the incoming ciphertext and associated data blocks and comparing the resulting tag value with the received tag value. As defined by the GCM mode of operation, associated data is included in the authentication tag calculation.

XIP1113B can also operate with zero-length associated data, meaning that XIP1113B treats all signals on the input data\_in as plaintext to be encrypted or as ciphertext to be decrypted. XIP1113B can also operate with zero-length plaintext or ciphertext, in which case it acts only as an authenticator or authentication validity checker.

XIP1113B outputs first the associated data, followed by encrypted plaintext or decrypted ciphertext (depending on the mode of operation), and as the last output the tag value and associated status signals.

## Block Diagram

The internal high-level block diagram of XIP1113B is depicted in Figure 1.

## Interfaces

The external interfaces of XIP1113B are depicted in Figure 2. In addition to pure logic interface Xiphera can provide a register and/or streaming based interface to XIP1113B, which supports most commonly used interfaces including AXI4-Lite, AvalonMM, WishBone and for streaming AXI4-Stream. This provides easy integration with existing design and hard/soft processing units.

This Product Brief describes a high-level overview of the functionality and capabilities of XIP1113B. Please contact sales@xiphera.com for a complete datasheet with a detailed description of the input and output signals, startup procedure of XIP1113B, example simulation waveforms, and the FPGA resource requirements of your targeted FPGA family.

## FPGA Resources and Performance

Table 1 presents the AMD® FPGA resource requirements for representative implementations on two different AMD® FPGA architectures. On request, the resource estimates can also be supplied for other AMD® FPGA families.

Device	Resources	$f_{MAX}$	Max. throughput*
AMD® Zynq-7000® †	3626 LUT	184.95 MHz	1.69 Gbps
AMD® Zynq® MPSoC†	3218 LUT	438.21 MHz	4.01 Gbps
AMD® Kintex® UltraScale+†	3144 LUT	485.20 MHz	4.44 Gbps

Table 1: Resource usage and performance of XIP1113B on representative AMD® FPGA families.

Figure 1: Internal high-level block diagram of XIP1113B

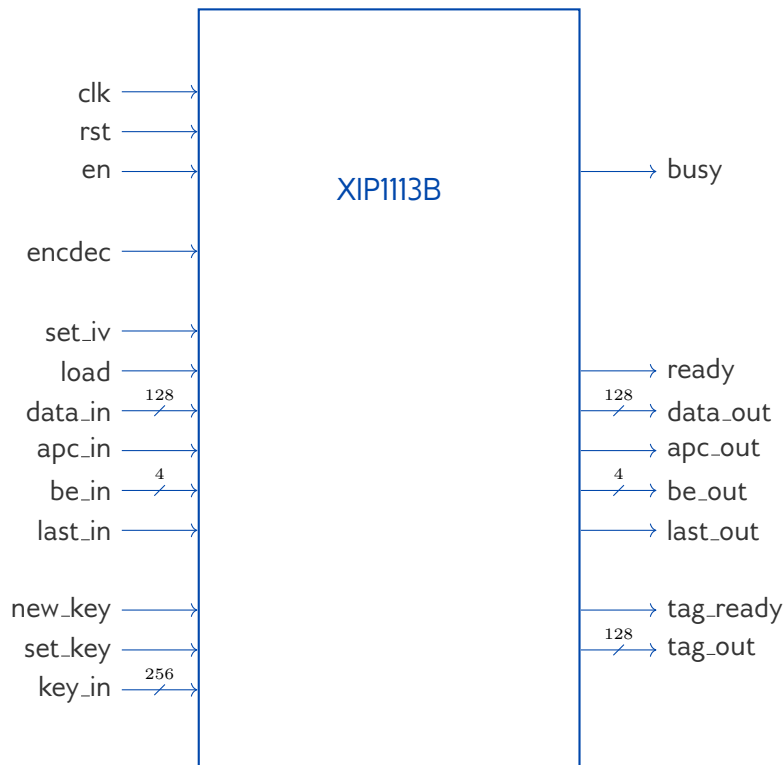

Figure 2: Interface diagram of XIP1113B

## Example Use Cases

XIP1113B has several applications, as AES-GCM is a popular AEAD algorithm in a number of standardized communications protocols, including IPSEC, MACSEC and TLS (Transport Layer Security) versions 1.2 and 1.3. Additionally, AES-GCM is used in fibre channel communications and tape storage applications.

## Ordering and Deliverables

Please contact [sales@xiphera.com](mailto:sales@xiphera.com) for pricing and your preferred delivery method. XIP1113B can be shipped in a number of formats, including netlist, source code, or encrypted source code. Additionally, synthesis scripts, a comprehensive testbench, and a detailed datasheet including an integration guide are included.

## Export Control

XIP1113B protects data confidentiality and is a dual-use product as defined in the Wassenaar Arrangement. Consequently, the export of XIP1113B is controlled by Council Regulation (EC) No 428/2009 of 5 May 2009 and its subsequent changes.

XIP1113B can be immediately shipped to all European Union member states, Australia, Canada, Japan, New Zealand, Norway, Switzerland, United Kingdom, and the United States.

\*Throughput =  $\frac{f_{MAX} * 128 \text{ bits}}{14 \text{ clock cycles}}$ ; achieved asymptotically with long packets.

†Vivado 2022.1, default compilation settings, industrial speedgrade.

Export to other countries requires authorization from The Ministry for Foreign Affairs of Finland, and a typical processing time for an export authorization is a few weeks.

## About Xiphera

Xiphera specializes in secure and efficient implementations of standardized cryptographic algorithms on Field Programmable Gate Arrays (FPGAs) and Application Specific Integrated Circuits (ASICs). Our fully in-house designed product portfolio includes individual cryptographic Intellectual Property (IP) cores, as well as comprehensive security solutions built from a combination of individual IP cores.

Xiphera is a Finnish company operating under the laws of the Republic of Finland, and is fully owned by Finnish citizens and institutional investors.
